

Total Control of TB

Our impact across diverse countries

Over the past 15 years, Humana People to People members have implemented TB projects impacting over 15 million people. We've built community-based networks of passionate local volunteers who are at the center of bringing TB services to the people at community-level. We've assisted millions of people living with TB and their families to overcome barriers driving stigma and discrimination. We've given emotional and nutritional support to people taking daily TB medication, and given them funds to meet transport costs related to accessing services. We have worked with health facilities and staff to provide health services. We are proud of the impact we've had across communities, countries and continents. Below is a small sample of our recent work.

Angola

Our community HIV and TB Project in Angola is reducing the impact of TB by improving methods of prevention, referring for treatment and care. Directly Observed Therapy is strengthened by establishing functional TRIOs for effective treatment adherence.

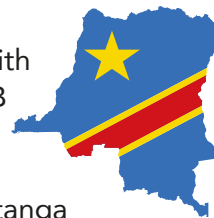

ADPP Angola started the first sputum collection and supported the production of the first TB Community strategic plan.

In 2022, the project reached 24,424 people with TB information and identified 4,023 TB cases who were supported through Directly Observed Treatment therapy across 23 municipalities.

Democratic Republic of Congo

In 2022, HPP-Congo reached an excess of 1.9 million people with TB prevention messages. Focus is on stopping the spread of TB by finding presumptive cases, collecting sputum to the lab for testing, bringing results to the people and linking TB positive people with health facilities for treatment and care. TCE-TB Katanga conducts active case finding, addresses stigma and discrimination through raising awareness in Congo, D.R.,. People screened are referred for TB diagnosis at the local health facilities and initiate those that test TB positive on treatment. The project reached 913,676 people, referred 113,063 presumptive cases and 12,424 people were diagnosed with TB in 2022.

India

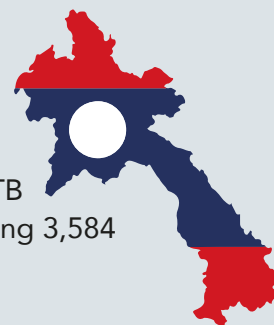

Humana People to People India is contributing towards the achievement of Government of India and WHO End TB Strategy targets of reducing TB incidence by 90% and deaths by 95% through its TB projects. The projects are increasing treatment coverage of all forms of TB and supporting community systems for resilient and sustainable TB services. In 2022, the projects ensured that 107,061 people were screened, resulting in the identification of 212 people being initiated TB treatment.

Laos

HPP Laos's Total Control of TB Bolikhamxay and Oudomxay projects raise awareness about TB and identify people infected with TB through active TB case finding. Treatment supporters are trained to support those infected with TB to adhere to treatment. In 2022, the projects reached out with TB related messages to 133,788 people, this resulted in identifying 3,584 TB presumptive cases of which 297 tested positive for TB.

Malawi

DAPP Malawi through USAID funded TB LON II Project is reducing the burden of TB by actively finding TB presumptive cases both at health facility and community, encouraging treatment initiation and adherence for both drug susceptible and resistant TB patients, providing psychosocial counselling and food supplements as part of ensuring successful treatment completion. In 2022, the project reached out to 875,216 people with key TB messages, screened 617,683 people for TB, identified 60,368 presumptive cases and diagnosed 1921 people with TB.

Mozambique

Local TB Response Project in Mozambique increases the number of people diagnosed with drug-resistant and Multi-Drug Resistant TB, links them to health facilities for treatment and organises community support. The project is renovating and equipping health facilities with diagnosis machines and laboratory supplies to ensure effective diagnosis of TB. Integration of digital technology in community-led monitoring is identifying and resolving TB testing and treatment barriers. In 2022, ADPP Mozambique carried out TB activities in 51 districts spread across five provinces. Over 1.8 million people were screened for TB from the total more than 29,000 people were diagnosed, referred for treatment and supported to adhere to treatment until cure.

Zimbabwe

DAPP Zimbabwe's TC-TB Makoni gives access to TB and HIV health services to the people as part of raising TB prevention, diagnosis, treatment and care. Contacts for former TB patients are traced for any chances of infection and those found TB infected are initiated on treatment. The project supplies health facilities with laboratory equipment for rapid and accurate diagnosis of TB. In 2022, over 98,000 people were reached with TB-HIV information for prevention, 50 local leaders were trained on TB awareness raising, reduction of stigma and discrimination and 55 TB patients were identified.
